

Review of: "Analysis of climatic parameters in the upper Awash River basin of Ethiopia"

Wenlong Hao

Potential competing interests: No potential competing interests to declare.

The methods used in this study are linear regression line, standardized anomalies, and coefficient of variation which are very common in the analysis of hydrology time series. However, it seems hard to find clear novelty and originality of this paper because there are a lot of related studies. Thus, it will be better that the authors re-organize the structure of the paper in order to express their contributions effectively and emphasize the originality and novelty of this paper. Although the methods are common, the results and conclusions are meaningful for this area. The time period is 1991 to 2020 (only 30 years). Whether your sample size is too small?
