Potential competing interests: The author(s) declared that no potential competing interests exist.

This is a single center retrospective study, patients was arranged into two groups according to different LA_{di}. Then the author explored the association between LA_{di} and MACEs in these patients using logistic regression. The funding of the study may have clinical significance in predicting patient's prognosis. I think it's worth publishing. However, there are still several points to improve. Such as, for a retrospective study, the author should follow the STORBE guideline to report related contents of the study. The statistic methods need to be more clearly and improved. The writing needs to be improved. For details please see comments.
