**Potential competing interests:** No potential competing interests to declare.

I find it a very interesting article, especially when it puts limits on the use of CT scans. During the years of COVID-19, we saw how many health resources were wasted and patient exposure increased. As the article also comments, subjecting a positive patient to this test can increase the risk of spread of the virus in these types of machines, with being the best screening tool.

I would add a paragraph about the appropriate use of resources, especially when working in systems dependent on insurance and that the more you spend, the more you earn, which should not be so generalized in medicine, not only because the resources can be limited, but also because of the problems of pollution and overexploitation of the planet.

In a globalized world, it is not worth thinking small; you have to think on a large scale, and these types of articles help to provide awareness tools.
