Potential competing interests: No potential competing interests to declare.

This is a manuscript that has a good experimental hypothesis, which concerns the impact of a probiotic coating over the refrigerated storage of chicken breast against staphylococcus strain. Nevertheless, the results are not adequate and the knowledge offered is insufficient. The manuscript is too short and the results recorded are preliminary. The language is poor and the manuscript needs improvement. The originality of the experimental designation is not clearly stated in the introduction section. Moreover, table 1 and figure 1 represent the same thing. Meanwhile, some extra analyses, like pH values, cooking loss, other microbial groups and sensory evaluation of the samples examined should have been included. In its present form, I wouldn't advise you to proceed to its publication in your journal, unless for short communication article.
