

Review of: "Comment on "On the linearity of the generalized Lorentz transformation""

Rasha Aldinari

Potential competing interests: No potential competing interests to declare.

I have remarks on this paper,

1. The paper needs to be reformulated and restructured as follows: The abstract is very poor; The introduction is very short so' the author should add more details about Verheest's original proof for the linearity; The structure of the paper which includes the sections and subsections are not mentioned; The discussion and conclusion should be added.
2. The author should add some applications to show the importance of the minor gaps, that he added on Verheest's original proof for the linearity of the one-dimensional Lorentz transformations.
3. The author should add more references about Lorentz transformations and Verheest.
