

Review of: "Designing for Social Sustainability: How Urban Environments Influence Crime"

Gualdemar Jiménez

Potential competing interests: No potential competing interests to declare.

Introduction

It is an important reference on a current problem such as climate change, in addition to variables such as population density, eradication of green areas, which contributes to a discussion of the ecosystems that contribute to the balance and survival of urban areas.

In this sense, the analysis developed is important, which could be important to develop with comparative research, so the populations to be studied can be from the northern and southern hemispheres, with which the variables, in addition to climate, vegetation, could occur in compliance with rights.

Methodology

The authors could include interviews that can contextualize reality.

Analysis

It is not possible to determine a single variable in crime issues, in this aspect the study can be complemented with variables that can better determine the elements of crime, such as rights such as health, education, recreation, among others.

Extension

It is too long a document.

Conclusion

The article is an interesting proposal that can be strengthened with a comparative analysis, from this logic one could recover social behaviors taking into account the issue of climate, human rights and social environment.
