After thoroughly reviewing the research paper titled: "A Study for Estimation of Greenhouse Gas Emissions of Cotton in Central Greece." I would like to recommend this after following considering the following concerns raised,

- I. Abstract should be re written in context of objective and findings of the work conducted.
- II. You need to increase the analysis over five years of time span. From one single year results may not be reliable
- III. You also may consider other analysis statistical tool in addition to CFT tool.
- IV. The field studied and the crop production location must be specified including the geographical co-ordinates
- V. Please specify the key finding of this research work conducted. Data sources must be presented.
- VI. You in total selected twelve farmers in the three different regions for data collection. However, the area cover by each is not specified.
- VII. How the pH of soil samples determined? it is pre or post cotton cultivation results.
- VIII. Table should be drawn based on the standard journal format.
- IX. Discussion is poor needs to be improved by citing the relevant literature survey of the published work on same subject area.
- X. Conclusion must be revisited.

Further it is suggested that you should provide the information of field visits which were conducted for the 12 fields (4 farms for each site). Provide the dates of the field visits and include photographs of the field conditions.
