The scientific work entitled: Demographic and Clinical Characteristics of Refugee Children Utilising Healthcare Services of Türkiye (2021-2022): A Single-Centre Study" contains very important information on the health of migrant children. The study is well researched and well written. Well discussed own results with available literature. A positive aspect of the work is the inclusion of a large number of patients in the observational study. Although, as the authors write, the work is limited to the Istanbul region, the population analysed is representative for the conclusions.

I have some comments on the results:

Table 1

Other nationalities are many patients, can you name their countries?

Table 1

Have patients with emergency admission been tested for undernutrition, iron, and vitamin D deficiency?

Diagnosis Others is high for emergency weight gain 17.4%. Could they be named? Detailed results, incl. ICD coding, should be shown in the Supplement.
