Potential competing interests: No potential competing interests to declare.

The paper addresses the question by using a combined method for measuring inequality. I would suggest three points for improvement:

a/ The paper should take into account the (diverging) effects of compensatory income/(un)employment programmes during the pandemic.

b/ The paper is very descriptive; it should also seek causal explanations in order to explain major regional discrepancies.

c/ The paper needs to draw better and more detailed conclusions on the spatial dimension of inequality in Greece.
