Potential competing interests: No potential competing interests to declare.

1. How the children were selected i.e. sampling technique? What was the lower age limit taken in the study?
2. The correct term would be "Multivariable Logistic Regression" instead of multivariate logistic regression.
3. Table 1: so many percentages are not coming to 100% i.e. age group of mother, educational level etc.
4. The output of multivariable regression is incomplete. What about model fitness, variation of dependent variable explained by independent variable.
