INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. [Localized lichen myxedematosus](#). ORPHA:86795

Localized lichen myxedematosus is a group of skin diseases characterized by the development of papules, nodules and/or plaques with mucin deposits and a variable degree of fibrosis in the absence of thyroid disease. The group comprises five sub-forms: nodular lichen myxedematosus, discrete papular lichen myxedematosus, papular mucinosis of infancy, acral persistent papular mucinosis and self-healing papular mucinosis.
