

Review of: "Assessment of Quality, Bacterial Population and Diversity of Irrigation Water in Selected Areas of Minna, Niger State, Nigeria"

Fridah Gacheri

Potential competing interests: No potential competing interests to declare.

The Manuscript is intriguing, but there are a few things that need to be considered.

1. The abstract needs to be precise and re-organized for clear understanding of the study.
2. The information describing world water quality standards after the objectives needs a heading, and a latest reference can be used instead of FAO, 1995.
3. The H₂S Test and O₂ Relationship Test need to be written in full.
4. The symbols for degrees Celsius need to be corrected.
5. The authors need to assess their findings based on other studies and give an authentic discussion that makes the paper relevant in the field.
6. Generally, the references need to be worked on by changing to recently published works and considering uniformity where many authors are involved, by putting italics where necessary.
