This manuscript provides a valuable critical review of non-clinical research associated with COVID-19 vaccines. The comprehensive analysis of a diverse range of scientific documents covering different vaccine platforms is integrated. The author showed and discussed the relevance of non-clinical findings of COVID-19 vaccines and their relation to clinical adverse events.

A key finding of the manuscript is the significant disparity between the number of clinical and non-clinical studies focusing on the potential toxicity of COVID-19 vaccines, especially for mRNA vaccines. This observation is important and deserves further exploration.

The manuscript is well-written and presented. Based on the above, I recommend accepting this manuscript for publication.
