Suggestion to the authors:

1. The language is okay, but it can still be improved.
2. This work's problem statement is not clear and straightforward.
3. Any cost analysis is needed because the authors claim a low-cost system was used.
4. Figure 5-20 is not necessary. Discussion regarding the components should be reduced. Providing the type or model and some important information is enough.
5. The measurement data can be combined into one table, and the error analysis into another table.
6. The R^2 comparison with the literature can be placed on a table.
