Potential competing interests: No potential competing interests to declare.

The study addresses a significant area of research by examining the impact of macroeconomic variables on market capitalization in an emerging market, which is highly relevant for policymakers and financial analysts. While the findings are significant, the study would benefit from a deeper discussion of the contextual factors specific to Bangladesh that might influence the relationship between these variables and market capitalization. The study should expand on the practical implications of the findings for policymakers and financial institutions. Recommendations on how to leverage the positive impact of IDR and mitigate the negative effects of MKTINT and CPI would enhance the study's practical relevance.
