**Potential competing interests:** No potential competing interests to declare.

These are my comments for the article entitled: "Thermal Comfort Temperature Evaluation in Hospital Wards for Patient Safety and Climate Change Sustainability."

1. Explain graph 2 beforehand, not afterwards.
2. Explain the perturbation between 20 and 30 °C in figure 3.
3. Figure 4 does not see clearly.
4. Explain figure 4 beforehand, not afterwards.
5. Explain figure 5 and 6 beforehand. I think they should explain and use their figures more.
6. I also think they should discuss linear regression models and coefficients of determination more.
7. Define the symbols, a table can be used to make it easier to read.
8. About the references, put the DOI or the URLs

Finally, I think that there is a lack of discussion about all the statistics that have been collected, they are not being used in depth, and I think that this would enrich your research.
