This article provides an overview of various uses of AI in generating new ideas and knowledge. The title suggests that the key role of humans is as prompt engineers or some equivalent thereof to ensure that the machine is given the “right” task (also ethically). The article would benefit from further elaboration of Figure 1, which seems to be the main contribution, perhaps by giving 5-8 scenarios that meet the proposed cyclical approach (human/machine/human/machine) or do don't.

Small point but I am not sure that AI has "redefined" creativity. It does, however, provide a new set of tools.
