Potential competing interests: No potential competing interests to declare.

The article I received is well-written and succinctly reviewed; however, it lacks in detail. For example, biofilms contribute hugely to dental caries, etc., and these also contribute to AMR. Although not directly linked to this area, I think it needs to be included. I would have thought the causative organisms from dental abscesses could originate from biofilms. They need to be described, and any link explored.

In addition, the treatment of abscesses is not only antibiotics and drainage, etc.; root canal involvement features strongly here, often with root canal involvement. I think exploring new methods of treatment in the wake of AMR should be explored.

Finally, the review finishes too quickly without any conclusions.
