the authors of this paper have presented an efficient computational method for evaluating complex reliability based on fault trees. the proposed method has been explained in a detailed manner with more of examples for better understanding, the approach is innovative and the literature referred is very relevant. My concern is there should be a discussion paragraph to highlight the three goals and a comparison paragraph stating the work superiority. Moreover the three goals should be shown with practical cases (if possible in terms of figures) then it would give more weightage to paper
