**Potential competing interests:** No potential competing interests to declare.

The review "Green Strategies for the Synthesis of Quinolone Derivatives" made good efforts to compile all relevant data. The language is also easy to follow.

The atom numbering should be rechecked and put correctly, i.e., near ring atoms or substituents.

Out of 23 schemes, only two schemes (only 10, 12, and somewhat 14) could be called green strategies. Some more green synthetic methods could be included for reader interest.

Results discussion is too small; authors should describe how one is better than the other?

The title is not appropriate, since green synthetic schemes are less in number.

Authors could improve the review.

Good luck!
