Potential competing interests: No potential competing interests to declare.

The authors presented three interesting presentations of patients with overwhelming post-splenectomy bacteremia due to Streptococcus bovis group organisms. The manuscript deserves the attention of the scientific and professional public, but certain corrections should be made.

1. In the introductory part of the manuscript, a concise description of the most important characteristics of Streptococcus bovis group organisms should be given.
2. Please define which techniques or methods were used to identify the cause of the infection.
3. In conclusion, it would be desirable to summarize the findings about the effectiveness of certain groups of antibiotics in the treatment of patients with this infection.
