Potential competing interests: No potential competing interests to declare.

This was an interesting article to read. My one concern was the lack of references, but I see the authors have added additional references. Some of my thoughts here include:

1. The sentence: "The traditional classroom or rote learning is an outdated way to educate students", could use some additional references. Even though educators try to be more student-centered in their approach to teaching, research shows that students prefer a blend of teacher-and-student centered. Clarifying this will help the reader immensely.
2. How was motivation measured in the study?
3. The rubric was good and well-explained, but who used it?
4. What kinds of visual aids did the students use to demonstrate that work? Was PowerPoint acceptable or did it have to be something hands-on.
5. Overall, this was a good study and would add significantly to the body of research.
