Potential competing interests: No potential competing interests to declare.

I found the article by Ferjaoui et al. intriguing as it looked into the incidence and risk factors associated with biliary complications following liver transplantation. Despite the significance of the subject from a clinical perspective, the paper lacks novelty and does not contribute any new insights. Additionally, the sample size is limited, and there are grammatical errors throughout the manuscript.

A more informative approach would involve comparing the characteristics of patients with and without biliary complications.
