Potential competing interests: No potential competing interests to declare.

The article is straightforward, describing a variation in the division pattern of the brachial artery. Even if the subject is not original, the value of this paper is represented by providing the scientific community with a new case report. The aim of the paper should be modified accordingly.

The paper would benefit from a more in-depth discussion of the clinical implications that such anatomical variation can have.

Figure 1 should report the source of the image, specifying if this is from the case or other publications.

It would be beneficial to have the personal pronouns removed and the article rewritten impersonally.
