

# Review of: "Overwhelming Post-Splenectomy Bacteremia Due to Streptococcus bovis Group Organisms. Report of Three Cases and Review of the Literature"

Tuğba Erat

Potential competing interests: No potential competing interests to declare.

*Streptococcus bovis* is not one of the microorganisms expected for sepsis after splenectomy. This data contributes to the literature due to its rarity. The authors have compiled the study to consolidate existing knowledge and provide a comprehensive overview. But in my opinion, revisions are necessary to increase the depth of the text and the clarity of the facts. It is recommended to give antibiograms for gram-positive microorganisms. The entire article should be reviewed; the cases, and especially the discussion section, should be deepened, and the necessary inferences should be stated.

Thank you
