Review of: "Cancer Mortality Among Women in the European Union: A Comprehensive Analysis of Economic, Social, and Health Factors"

Osayamen Igunma¹

1. Epidemiology, University of Alabama at Birmingham, United States

The author did a fantastic job of looking at cancer mortality among women and bringing to light how various social determinants influence health. It is true that there are cancers that are common among women due to biological factors; however, not much is said about how economic and social factors such as education, food access, insurance, housing, and other health-related underlying factors predispose individuals, and in this case women, to various cancers and the subsequent increase in mortality among this demographic. I am impressed by the factors identified by the author and the statistical method used for analysis. The author also did a good job of making the paper clear and easy to follow by dividing it into various sections with relevant figures for results. Overall, it was an interesting read.
