In this paper, the author has tried to use correlation coefficient for studying the incidence of COVID-19 in 58 different counties in the state of California in the United States. For this purpose he has taken five independent variables into consideration.

The paper being a preprint version seems to be in a very crude form. The author seems to be exploring different methodologies and there are several mistakes. This makes it very confusing and difficult to understand. Some of the mistakes are listed below.

1. The equations are not numbered.
2. The equation used for Duration and the equation mentioned in Figure 4 don't match.
3. The denominators of the equations l(x) and D(x) have been changed in the new version of this preprint. Only two variables are take in the denominator without proper justification.
4. The Tables and Figures are not interpreted properly.
