Potential competing interests: No potential competing interests to declare.

In general, this article's conceptual scope is too extensive to be reviewed in a single manuscript. I haven't identified the main point that the author will express. At the end of the introduction, the author conveys the objectives, which include explaining how the current COVID-19 pandemic has adversely affected people's social lives through social distancing, lockdown conditions, and quarantine, discussing the various modes of transmission of the coronavirus, the impact on the central nervous system of humans, and the smart lockdown policy implemented by Pakistan to prevent the devastating effects of the virus and minimize major economic. This purpose is extremely broad. Can you explain the major goal? For example, if the final goal is the smart lockdown policy implemented by Pakistan to prevent the devastating effects of the virus and minimize major economic losses, then the accompanying goals should be relevant to the main goal.

Is the influence on humans' central nervous systems linked to significant economic losses? This must be considered. I emphasize the connections between these goals. Next, a description of the impact of COVID-19 on people's lives; I believe it is more relevant to share data collected in Pakistan, as it relates to the goals of Pakistan's smart lockdown strategy, so this description fits in with the series of evaluations. I believe there has been a lot of research into the influence of COVID on mental health in Pakistan.

What is the relevance of the sub-chapter "Host Susceptibility to COVID-19" to mental disorders? Will it be transmitted that people with mental illnesses (which this chapter briefly mentioned stress-like condition, which impacts vulnerability to Covid-19)? If this is the direction, a further in-depth review is required.

Likewise, how does the Modes of Transmission sub-chapter relate to the main topic?
