Inhibitor of Nuclear Factor Kappa-B Kinase Subunit Epsilon

National Cancer Institute

Source

National Cancer Institute. <u>Inhibitor of Nuclear Factor Kappa-B Kinase Subunit Epsilon</u>. NCI Thesaurus. Code C147989.

Inhibitor of nuclear factor kappa-B kinase subunit epsilon (716 aa, ~80 kDa) is encoded by the human IKBKE gene. This protein plays a role in the regulation of both nuclear factor kappa-B signaling and interferon expression.
