Review of: "A Security Framework for the Mobile Application Using Color Barcode"

Huy Nguyen[1]

1 Kookmin University

This paper presents the security framework for the mobile application using color barcodes.

However, the idea is not novel in particular. The data rate can be increased, but the performances are lower compared to black-white barcodes.

Examples: lower distance, mobility environment, blur conditions, should also be considered. The quality of the color camera should be shown in the paper.

The work does not actually offer a framework, whether conceptual or related to software engineering. It could be enhanced by creating a conceptual use case or developing a software library as the foundational element of the framework.
