

Review of: "What is it like to be an AI bat?"

Boris Slavin

Potential competing interests: No potential competing interests to declare.

The article is an overview of various points of view on what consciousness is. The article also addresses the issue of the possibility of creating an artificial general intelligence (AGI) with consciousness like a human. The article is written vividly and interestingly. However, it considers consciousness only as a property of the individual, or as a property of nature. And even human social functions are considered as a manifestation of consciousness. But there is a point of view according to which consciousness has a social nature and is not located inside a person. For example, in the work of S. Sloman, R. Patterson, A. Barbie, "Cognitive Neuroscience Meets the Knowledge Community," *Frontiers in Systems Neuroscience*, Volume 15, No. 675127, pp. 1-13, October 2021. It seems to me that such a position should also be indicated in the review. Moreover, it is the social nature of consciousness that can be the basis for the framework of AGI creation, as I wrote in the article "An architectural approach to modeling artificial general intelligence," *Heliyon*, Volume 9, issue 3, March 2023, e14443
