**Potential competing interests:** No potential competing interests to declare.

-The insurance industry is vital for growth and development yet not as vibrant in Africa as in other continents. This study therefore investigates an interesting and important topic. Good justifications are given for the selected variables etc. there are however few issues to be addressed

- It will be appropriate to state that the target population is the entire insurance firms in the region so that the sample size becomes the selected 17 firms.

-It is important to state in the methodology section, the kind of estimation technique employed in the regression analysis and its justification

-Few sentences do not read well and need clarity, for instance.. "fixed effects models (FEM) and random effects models (REM) to robustly the OLS regression results and give more valid results"

Again, "...with a regression coefficient of ( $\beta = 0.0483$ ), has a positive and statistically significant...". I recommend a thorough proofreading of the article

-In discussing the results, the authors make mention of the " financial performance of commercial banks", the study however is investigating the performance of insurance firms. The necessary corrections need to be done
