Thanks to the Editors of Qeios for inviting me to review this paper.

This is an engaging and well-written paper that I enjoyed reading very much. The author provides a thorough examination of the concepts of objectivity and subjectivity as well as an implementation of epistemological thinking on complexity in education science. The analyses of different paradigms well extends the scope of the current paper and is indicative of a more universal shift in how science is perceived and practiced. Future work might therefore focus on which academic fields these paradigm shifts apply to, in addition to education sciences.
