Thank you for availing me the opportunity to review this manuscript and the following are the observations the authors need to address:

1. The abstract of the paper is too long and needs to be shorten concise with the right information
2. The household wealth was categorized into five stages and the authors need to explain further the point mark for the categorization
3. 'Field team members were oriented on various aspects of the study' what does the authors mean by this term?
4. Anthropometric Measurements specially the MUAC and Shakir tape should be cited
5. The family type presented in the results should be categorized as single parent, nuclear and extended family type
6. The authors should provide us the figure representation prevalence of SAM cases of the MUAC measurement
7. The authors could better discussed the findings of the study and should highlight the strengths of the study.

I really appreciate the efforts of the authors.
