Potential competing interests: No potential competing interests to declare.

The article provides a comprehensive overview of various structures and measures in the context of SAT problem solving. The authors have successfully explored the relationships between these structures and measures, shedding light on their interconnections. The practical applications of these concepts, especially in the realm of software engineering and propositional logic, are well-presented and discussed thoroughly.

However, to enhance the article's academic rigor and depth, it is recommended that the authors incorporate rigorous theoretical foundations alongside their discussions. Establishing a strong theoretical framework would provide readers with a clearer understanding of the underlying principles and enhance the overall scholarly value of the article. With this improvement, the article has the potential to make a more significant contribution to the field of computer science.
