Spastic paraplegia-nephritis-deafness syndrome

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Spastic paraplegia-nephritis-deafness syndrome. ORPHA:2820*

Spastic paraplegia-nephritis-deafness syndrome is a complex form of hereditary spastic paraplegia characterized by progressive, variable spastic paraplegia associated with bilateral sensorineural deafness, intellectual disability, and progressive nephropathy.

There have been no further descriptions in the literature since 1988.
