

Review of: "Determinant of Vaccination Status among Children Under Five years in Mattu Town, Oromia Regional State, Ethiopia"

Gbolahan Obajimi

Potential competing interests: No potential competing interests to declare.

The study is a fair attempt at documenting the challenges of vaccinations in developing countries. The study highlighted the importance of various indices that influenced the odds of vaccination in the under-five age group.

However, there were several typographical and grammatical errors noted in the manuscript. The author should report his findings in the past tense for consistency.

The discussion, in some aspects, repeated the findings already mentioned in the results section. The conclusion could be improved to further emphasize the outcomes of the study alongside practical steps to enhance vaccine uptake in the region.
