Potential competing interests: No potential competing interests to declare.

The paper is about modeling or estimation for thermal comfort in a hospital. However, the writing language needs to be improved where many sections are unclear, and others are written with the help of AI rephrasing.

The introduction does not give the real objectives of the paper. The methodology does not show the model or method that is used to assess thermal comfort.

The results are unclear and do not give thermal comfort as one indicator for all factors like temperature, humidity, and others.

I humbly advise the authors to rewrite the paper in a way to has clear aims and results.
