Potential competing interests: The author(s) declared that no potential competing interests exist.

1. The paper is well-written. The only change that I would recommend is to change "predict fraud in the supply chain" to "predict frauds in the supply chain" in the introduction.
2. In my opinion dependent variable should be also mentioned in the table in the similar way as other variables.
3. What correlation measure was applied?
4. The information if the dataset is freely available to other researchers or not should be added.
5. Why the SCM, logistic regression, random forest, and an AI-based sequential model were used but not other algorithms (i.e. DBSCAN, kNN)?
