Review of: "Exchange Rate Pass-Through and Inflation on Unemployment in Nigeria"

Hien Thanh Hoang[1]

1 FPT University

Below are comments for this manuscript, I separated comments into three parts:

Positive Aspects:

- The manuscript is well-organized, using clear language and appropriate visual aids to convey results.

- The use of ARDL, NARDL, and SVAR models provides a thorough exploration of economic variables.

- The consideration of critical values and significance levels adds rigor to result interpretation.

- Distinguishing between long-run and short-run effects enriches the understanding of economic dynamics.

Areas for Improvement:

- Provide more detailed breakdowns in figures and tables to enhance comprehension.

- Expand on the justification for lag selection in the ARDL model to reinforce its appropriateness.

- Discuss potential implications of normality test results and assess robustness accordingly.

- Provide a more in-depth discussion on the implications of stability test results for result reliability.

- Strengthen the link between results and practical policy implications for a more actionable conclusion.

- Clarify the directionality of observed relationships to enhance the depth of result interpretation.

Limitations:

- Introduce a limitations section to acknowledge potential constraints or assumptions in the analysis.

- Ensure consistent use of terms throughout the manuscript for clarity.

- Double-check formatting and ensure consistent and correct citation application.

- The study could benefit from a more explicit acknowledgment of the scope limitations, outlining the boundaries of the analysis.

- Consider addressing any data limitations explicitly, acknowledging potential gaps or constraints in the dataset used.

- Emphasize that findings may be context-specific and caution against overgeneralization.
