

Review of: "Teaching Method Preference by College Teachers in India"

Anamika Sinha

Potential competing interests: No potential competing interests to declare.

It is an interesting question. However I have some concern. How has the author hypothesised that older teacher would use more traditional methods. also if the hypothesis is this then cross tabs and a basic Chi square could be used to explain the findings. Just descriptive statistics in percent will not suffice. Else hypothesis may be modified. Previous research and conversation on experience and teaching style can be added as well.

Sample description is missing- in management education vs design school or English literature class, undergrad, post grad? Details will add value to the insights
