

Review of: "Evaluation of Ambient Air Quality Levels at Various Locations within Lead City University, Ibadan"

Caner Taskopru

Potential competing interests: No potential competing interests to declare.

- 1.) The purpose of the work in the manuscript is constantly repeated. This should be corrected.
- 2.) The reasons for parameter choices are explained. This has been successful.
- 3.) A few examples of the effects of particulate matter on health should be given, and the explanation should be expanded.
- 4.) The brand, model, and similar features of the equipment used in the study should be clearly stated.
- 5.) The units of the measured parameters should be added to all tables, e.g., temperature (°C), humidity (%), CO₂ (ppm), etc.
- 6.) It is not clear what the axes are in Fig 1 and Fig 2. What does the x-axis indicate? What does the y-axis indicate?
- 7.) The figures in Fig 1 and Fig 2 are not very useful as the data obtained is in different units and has different magnitudes. They should either be corrected or removed from the manuscript.

In conclusion, it is stated in the explanations that the manuscript needs to be edited. After these edits, it can be useful for the literature.
