**Potential competing interests:** No potential competing interests to declare.

As a rigorous paper, it's important to have a clear description of the problem formulation. Giving examples is fine but this is just a tool to help readers understand what abstract mathematical problem you want to discuss.

And for the method author proposed, it would be better to have some theoretical proof like bound analysis or asymptotic analysis. If it's a practical paper, it would be more convincing if author can present a larger-scale and more complicated numerical experiment.
