The authors presented a manuscript entitled "Concentrations of Polychlorinated Naphthalenes in Food and Human Dietary Exposure: A Review of the Scientific Literature".

In this manuscript, the authors present a comprehensive review of the concentrations of polychlorinated naphthalenes (PCNs) found in various foods and assess human exposure to these environmental contaminants through dietary intake. The topic is both timely and relevant, as PCNs are emerging pollutants with significant health implications.

The paper is well-structured and clearly written, providing valuable insights into the current state of knowledge on PCNs in the food chain. The inclusion of recent studies and a thorough discussion of their findings enhance the manuscript's contribution to the field. The methodology used for the literature review is appropriate, and the results are presented in a coherent and logical manner.
