This manuscript is interesting, however, there are a few issues needed to clarify.

- ISTH DIC score should be used to confirmed the diagnosis of DIC in this patient. Therefore, the results of PT, fibrinogen and D-dimer should be provided apart from the results of ROTEM and platelet count.
- There are three subtypes of DIC including hyperfibrinolysis, coagulation and bleeding subtypes. Although malignacies usually associate with coagulation subtype leading to hypercoagulable state and thrombosis but this patient had intraperitoneal bleeding from ovarian cancer which associated with bleeding subtype. The bleeding subtype was confirmed by the hypocoagulative findings in the results of ROTEM (prolonged CTs and CFTs, decreased alpha angles, A10 and MCFs).
