CRP wt Allele

National Cancer Institute

Source

National Cancer Institute. *CRP wt Allele*. NCI Thesaurus. Code C60650.

Human CRP wild-type allele is located within 1q21-q23 and is approximately 2 kb in length. This allele, which encodes c-reactive protein, is involved in acute inflammatory processes and in immune recognition and effector function. The gene also plays a role in the clinical evaluation of cardiovascular disease.
