**Potential competing interests:** No potential competing interests to declare.

**Under “Supplementary Data”, you can find my detailed review of the manuscript ("review-qeios-v2.pdf").**

Summary: The authors attempted to provide an overview of what math anxiety is, how to measure it, and how it can be reduced.

Major Points:

- The text needs editing in English. There are many grammatical and syntax errors. These errors are highlighted in yellow.
- There are many articles on the topic that provide an overview of the literature, which makes me question the pertinence of the text. As I said in my comments, a study is implicitly and explicitly mentioned in the text. As such, it may be better if the authors write a manuscript describing this study in detail.
- One of the goals of the study (i.e., describing a new framework) is not met by the end of the text. Indeed, no framework, old or new, is described.
- The structure of the text needs to be reviewed (e.g., a sub-section is missing, see my comment on p.4).
