## Review of Measuring the Deviations from Perfect Competition: International Evidence

Interesting idea and well-structured article. Congratulations to the author for taking into consideration many countries in the analysis. I have the following observations:

- The abstract should have the main conclusions;
- Explain in more detail the main motive behind this study. Explain why you chose mentions of countries and specific economic indicators, and the data sources you used;
- Explain in more detail what cointegration is;
- Refresh references, with a suggestion to use references that have been published in the last ten years.
