Title: Breaking Stereotypes: Sectoral Varicocele Diagnosis Revolutionized by Doppler Ultrasound Advancements

Introduction:

I am pleased to submit my peer review of the manuscript entitled "Breaking Stereotypes: Sectoral Varicocele Diagnosis Revolutionized by Doppler Ultrasound Advancements," authored by Majid Jassim. This article explores the combined and comparative analysis of the importance of Doppler Ultrasound (DUS) and physical examination in the diagnosis of varicocele in practical use.

Overall Impression:

The article offers a positive impression. The clear articulation of the theoretical framework reflects the authors' expertise in the subject matter. However, some issues should be pointed out.

Recommendations:

1. In the methodology section, the author did not specify the diagnostic criteria when diagnosing varicocele with DUS. Please indicate the pathological limits of the diameters of the veins seen on ultrasound so that they can be identified as varicoceles.
2. In the discussion section, it would have been a more comprehensive article if the author had made a reference not only to how effective DUS is, but also to its financial burden.

Conclusion:

Although it is generally a well-written article, its contribution to the medical literature is questionable.
