MANUSCRIPT - "Assessment of soil erosion in the Cesar watershed, an initial step toward the restoration of the Cesar River"

The article untitled "Assessment of soil erosion in the Cesar watershed, an initial step toward the restoration of the Cesar River" is a traditional one that uses the USLE method suite. It is well built, developed and it is showing interesting results from a research area that needs technical information. I have few points to ask:

1) ABSTRACT - *"Finally, the study triggers a discussion on the sustainable management of the basin to explore solutions aimed at preserving the integrity of this vital water resource"*. - Is this water resource vital for who? Please, insert there.

FIGURE 1 - MAPS: this is a map that is not showing any geographical coordinates. Please insert the geographical coordinates at the watershed area. More than that, the Colombia figure is not good (not showing the neighbour countries or any other geographical features). Please, improve this map.

FIGURE 3 - Is there appearing an error at the sphere of ER 100 (year 2010)?

My opinion is a positive one for a publication at QEIOS. Thank you.
